

Summary for oniomMacGyver

1 Gaussian scripts

Read full usage description by running a script with `--help` or `-h`

1.1 prepare ONIOM inputs

	In	Out	Motivation
<code>gau_prmtop2gaussian.py</code>	<code>.prmtop</code> (or <code>.top</code>) plus <code>.inpcrd</code> (or <code>.crd</code> / <code>.rst</code>)	<code>.com</code>	Exact copy of forcefield parameters from Amber topology to gaussian.com file. Specially useful with parameterized ligands and newer forcefields (gaussian uses ff94 by default).
<code>gfreezer.py</code>	<code>.com</code>	<code>.com</code>	Freeze protein further than a distance from high layer. Can be used to generate an external layer of water molecules.

1.2 monitor and analysis

	In	Out	Motivation
<code>g2pdb.py</code>	<code>.log</code> / <code>.com</code>	<code>.pdb</code>	Visualize scans and optimizations in VMD or Pymol by producing a <code>.pdb</code> file.
<code>hiig.py</code>	<code>.log</code>		Get convergence situation of a job and a plot of energy along scan or optimization.
<code>gsurf.py</code>	any number of <code>.log</code> files	3D plot	Plot energy against 2 reaction coordinates in a 3D plot.

1.3 restart jobs

	In	Out	Motivation
<code>gx.py</code>	<code>.log</code>	<code>.com</code>	Restart calculation from a specific scan point (the last by default).
<code>gscan.py</code>	<code>.com</code>	<code>.com</code>	Automatically set up scans by specifying final distance of reaction coordinate.
<code>paimei.py</code>			Automatically restarts error jobs. Works well with scans and ground state optimizations. Read the manual for instructions.
